Utilization of Algorithms, Dynamic Programming Optimization

| Date	11 November 2022
Project ID	PNT2022TMID17260
Project Name	Real-Time River Water Quality Monitoring andControl System
Maximum Mark	2marks

INTRODUCTION

Since its inception in the mid-nineteenth century by "Richard Bellman," dynamic programming(DP) has been successfully applied to a wide range of issues in a variety of areas [1, 2]. One of the most important features of DP is potential to adjust for a structure's dynamics, and it is usually utilized by operations investigators to address problems existence decisions.

## DISCUSSION ON THE UTILIZATION OF DYNAMIC PROGRAMMING

Dynamic programming (DP) is the process which can easily be utilized to solve problems related to scheduling. Many researches executed the dynamic programming inthe scheduling problems. Other then scheduling exercises offered process of heuristic solution by implementing dynamic programming to determine the employment of out-sourcing as a mean to overcome the disruptions related to the supply chain in manufacture scheduling for unexpected consumer orders. The while a study conducted by in this study author established a program to schedulesurgical procedure at the hospital to reduced time of waiting, overtime in operating room and bed availability in ward.

ALGEBRAIC DYNAMIC PROGRAMMING (ADP)

Exact solutions of many problems can be obtained through dynamicprogramming (DP) algorithms especially in biology computations, more over in sequence alignment, scoring of phylogenetic trees and hidden Markov models (HMMs). Evaluation of distribution of score

Applications of Dynamic Programming
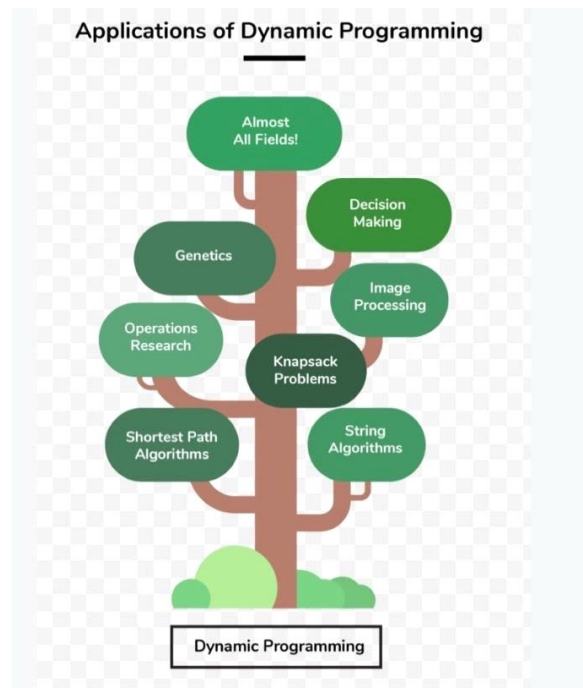

performing stochastic sampling and competitions for optimal solutions can be done via structurallyanalogous algorithms.

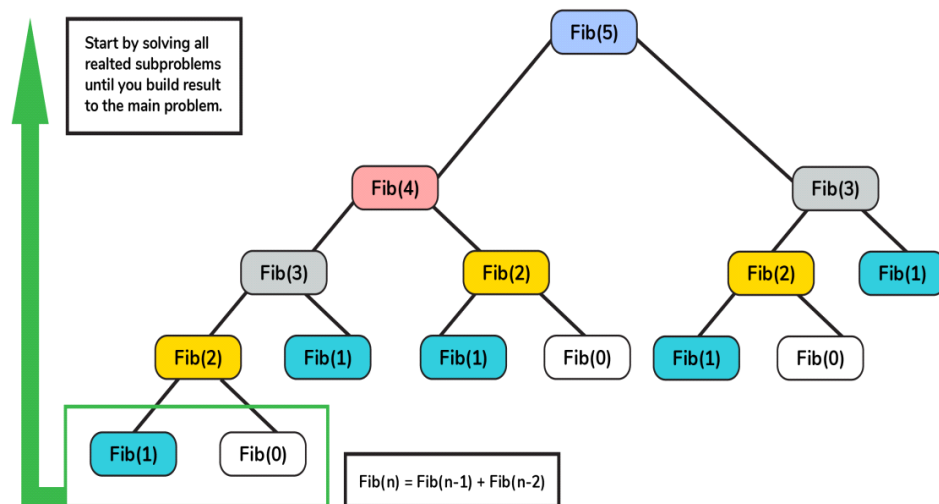

DP PROBLEM APPROACHES

According to the researches, the essential element and approximated solutions are determinedbefore the decision rule is being used to make or propose judgments, and when decisions are taken, the algorithm updates its estimate of the problem structure and the ultimate decision rule. Several algorithmswhich are real time learning based have the benefit of not having precise utility functions for the
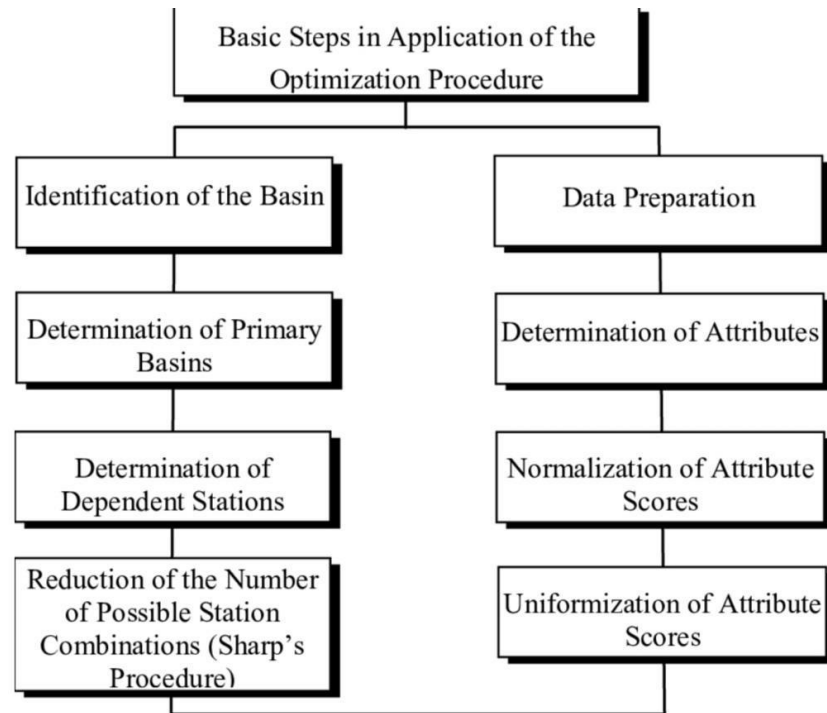

fundamental inclinations, assumptions, and "laws of motion" that ensures the integrity of the basicproblematic situation. An additional notable difference is either the learning is evaluated.

Bottom Up Approach

Start by solving all realted subproblems until you build result to the main problem.

DP APPLICATIONS TO IMPROVE DECISION MAKING

Additional issue that restricts the use of DP is that the target function that many organizations are optimizing is hazy and ambiguous. In economics, the default assumption by government companies is to maximize their market share. This is the expected trickle of future earnings reduced at a riskadjusted discount factor. Conversely, a significant body of financial evidence on the disproportionate stock price volatility market prices poses serious reservations about what the firm's net worth is comparable to its fundamental value, which is the estimated present value of its future income flow.

A flowchart titled "Basic Steps in Application of the Optimization Procedure" branching into two columns:

Left branch: Identification of the Basin → Determination of Primary Basins → Determination of Dependent Stations → Reduction of the Number of Possible Station Combinations (Sharp's Procedure)

Right branch: Data Preparation → Determination of Attributes → Normalization of Attribute Scores → Uniformization of Attribute Scores

EMPIRICAL DYNAMIC PROGRAMMINGAND THE IDENTIFICATION PROBLEM

The advancements in numerical DP paved the door for a burgeoning literature on empirical estimate and testing of SDPs and dynamic games. The existing knowledge on estimate of dynamic labor demand schedules in a linear quadratic framework began to condense around the end of the 1970s, at the same time as a number of publications appeared that gave diverse methodologies.
CONCLUSION

Dynamic programming (DP) is an exceptionally strong approach for handling a wide range of uncertain sequential decision problems. Indeed, it's difficult to imagine an issue that can't be expressedand solved with Dynamic programming.
